

Introducing GeoBubble™ Solar Cover Material

25%* LONGER LASTING

The GeoBubble design withstands chemical and UV attack, resulting in an expected increased lifespan of 25%+

What is GeoBubble?

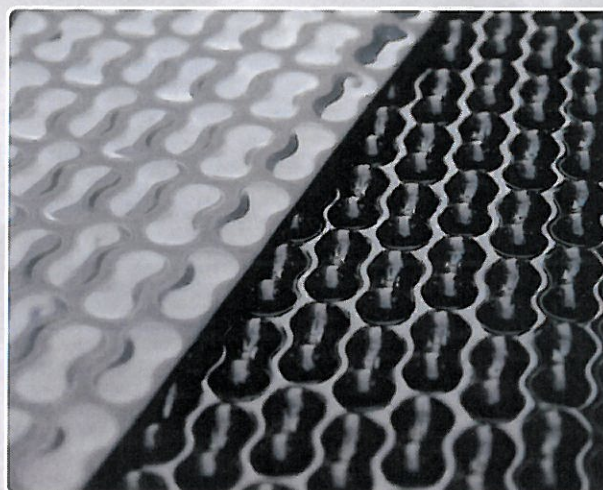

- A new innovative swimming pool bubble cover material created through extensive research and development. Scientifically designed to improve the lifespan of the material.
- The bubble shape has been developed specifically for use in swimming pool covers with a design that has many extra benefits compared to a traditional bubble material.
- GeoBubble has a distinctive shape that is unique and will catch the end consumers' attention.
- The next generation of premium swimming pool bubble cover material and is available in the Sol+Guard, EnergyGuard and CoolGuard range.

Scientifically designed to last longer

The two bubbles are joined together by a thick waistline structure, resulting in a larger footprint area that is more resistant to air expansion. By reducing the stress on the material this leads to an increased product lifespan.

The smooth shape and uniform thickness results in reduced stress and less thin points in the bubble. By eliminating these stress points the product will not prematurely fail through UV or chemical attack.

In comparison to a traditional bubble's weakest points the material is 50% thicker. This thicker material will take longer to breakdown, increasing the life of the cover.

Wide range of standard cut sizes
and bespoke shaped covers
